Mission Statement

The Scentroid DR1000 is a fully capable flying laboratory, used to sample and analyze ambient air at heights of up to 150 meters above ground. Air quality mapping, model verification, analysis of potentially dangerous sites are all made possible by this novel innovation.

Live Chemical Monitoring

The Scentroid DR1000 flying laboratory provides continuous monitoring of multiple chemicals. While in flight, five built-in chemical sensors can provide remote monitoring of chemicals selected at the time of ordering. Chemical monitoring can be provided for H₂S, CH₄, CO₂, SO₂, VOCs, and close to 30 other selected chemicals. Sensor readings along with GPS position and altitude can provide 3D mapping of ambient pollution and odour levels. This feature can also be used to guide the operator into a plume for bag sampling. See the table on page 11 for a list of the available sensors.

DR1000 can be equipped with up to 5 sensors from Scentroid sensor list.

Improves Air Sampling Capability over Difficult Terrain & at Different Heights

It is often necessary to sample stacks, ponds, and other location where human access is difficult and /or dangerous. Furthermore, operator exposure to dangerous chemicals during sampling must be carefully considered. The Scentroid DR1000 flying laboratory allows the operator to stay safely away from potentially hazardous sources while acquiring live readings or air sample for laboratory analysis. The DR1000 can also be analyze and sample ambient air at an elevation of up to 150 meters above ground level that was previously impossible to accomplish.

Endless Application

The DR1000 Flying laboratory provides a robust platform to conduct impact assessment and air quality measurement for a wide range of applications including monitoring of:

- Fugitive emission
- Flare emission
- Leak detection along oil pipe lines
- Landfill methane
- Odour emission
- And much more!

Thermal Imaging

A thermal imaging camera can also be installed for visual confirmation of fugitive emissions in a variety of applications such as landfills, storage tanks, and oil/gas pipes.

Recommended Drone

DR1000 is completely self-contained and requires nothing from attached drone except as a vehicle. DR1000 can be attached to any Rotary Wing or Fixed Wings drone with payload capabilities of 3 kg. An example of commonly used drones are DJI S1000 and DJI MATRICE 600.

Dust Monitoring

The Scentroid DR1000 flying laboratory can also provide continuous monitoring of PM 1, 2.5 and 10 using a laser scattered particulate counter. The dust monitoring can be installed in addition to the 5 chemical sensors for complete ambient air quality assessment

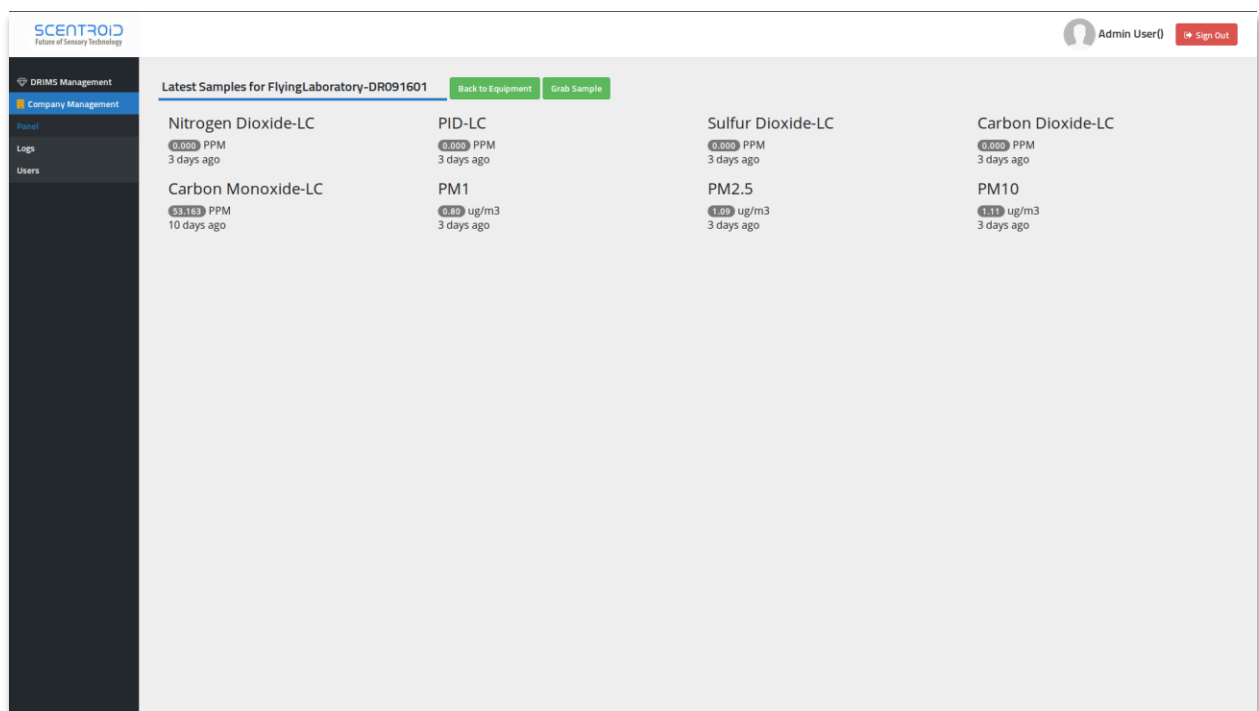

Direct Flare Plume Sampling

The DR1000 can be flown into the plume of a flare to take direct samples for analysis for chemical composition and olfactometry. Temperature and humidity of the plume are also measured to ease dispersion calculation as well as to keep the drone safe.

Communication

DR1000 will come with simultaneous GPRS and WIFI communication capabilities. The GPRS is used to send data to Scentroid cloud server called Drone Information Management System (DRIMS). The secure online system will allow you to remotely monitor and even control the flying laboratory as well as store and process the data collected. The Drone also connects to the ground station using WIFI communication protocol. Both Ground station and Cloud based servers run DRIMS software and simultaneously can log data from multiple DR1000 drones.

Ground Station

The Ground station that is included with every DR1000 Flying Laboratory consist of a specialized laptop with pre-installed Ubuntu and Windows 10 operating systems, high gain powerful communication antenna, and DRIMS software. DRIMS (Drone Information Management Software) provides the user with means to control the flying laboratory and log all acquired data. DRIMS will provide both live data as well as all historical data for all sensors plus GPS position, altitude, temperature, and humidity. The user can also command the drone when to take the sample, select the sampling interval, adjust sampling rate, and perform routine maintenance such as calibration of sensors. If an optional on-board camera is selected the video feed will also be sent to the ground station for simultaneous viewing. The laptop will be dual boot and can be used for other work including GIS mapping, viewing flight path on Google Earth, data post processing, or any other task.

DR1000 Specification

Manufacturer	Scentroid
Model	Scentroid DR1000 flying laboratory
Maximum operating time with full charge battery	2.5 hours
Time to fill up a sample bag	5 Sec per Liter
Weight	3410 g
Dimension	26cm x 16cm x 18cm
